

What does Business Manager offer that other systems don't ?

Global access to information

(Access your information from anywhere in the world.)

Traditional systems provide you with information only through the computer terminals in your office. Business Manager provides you and your employees with information at the office, store, home, laptop, cell-phone, Palm and any other Internet based appliance. So you don't have to be physically at work to take advantage of your system's information and services. With Business Manager you have access to information and services everywhere you go.

Lower cost of system maintenance

(Say goodbye to costly on-site technicians and specialists).

With the traditional systems, whenever you have a problem a technician or specialist has to be dispatched to your location. Your system or network is in operational or partly functional until it is attended to by a technician. Business Manager removes the inherent complexities of traditional systems and simplifies support and service issues. There is no need to dispatch a technician to your office in case of problems. All software and data related problems can immediately be resolved over the Internet. This eliminates expensive on-site support costs.

Cheaper cost of ownership and use

Business Manager eliminates the need to purchase, install and configure a copy of the software in your office just to be able to use it. You pay a monthly fee for the use of Business Manager and no longer have to invest large amounts of money in its purchase, installation and maintenance.

Easier system operation and maintenance

Since there is only one Business Manager to maintain and upkeep, you will always be using the most up-to-date version of the software. As soon as an enhancement is made, automatically it is available for all clients to take advantage of. So your company will always be using the latest release of the program.

Lower required investment in hardware to use the program

Leading edge web-based technology drives the new Business Manager Web. World's largest corporations and banks use oracle products and database. Sites such as cnn.com and amazon.com are all supported by Oracle. Same power is provided for all Business Manager Web clients. Therefore there is no need for you to install an expensive "Server" in your office. World's most powerful server is at your disposal and in charge of your company's crucial data. All that you need is a simple windows network and a connection to Internet.

Better system security and reliability

As more companies connect to the Internet for email, e-commerce and other benefits, they are vulnerable to security risks. Once your office is connected to the Internet, it does not matter where your data resides (on your own server or on the web), it is subject to security threats. Usually, companies purchase inexpensive security products which do not provide adequate protection. Business Manager Web utilizes the most advanced web security products available in the market today in order to ensure continuous system and database protection.

Trouble-free data backup & integrity

You don't have to worry about backing up your data anymore. Your company's data is properly backed up and maintained on a daily basis for highest data integrity and reliability.

Expand your business with features such as: e-commerce, email, EDI and Internet Fax

Having your program and database on the Internet provides you with features never available before. Your product information and pricing can be made available to potential clients on the Internet using the e-commerce module. Invoices, statements, order confirmations, purchase orders and all other business documents can be emailed, faxed or interchanged (EDI) using Business Manager Web.
